and surface  
sterilisation

Machine suitable for removing vegetables with small roots from the ground.

The use of this piece of equipment offers the following advantages:

- eliminates crop residue from the surface of the ground for fast vegetative cycle products (pre-cleaned and packed vegetables)
- speeds up the subsequent land surface sterilisation operation using the flaming method
- aerates the land surface layer; in many cases, the operation permits subsequent sowing without removing the soil, thus reducing weed germination

The equipment is available in different widths to cater for different needs.

It is also suitable for use with **slightly stony** soils.

The equipment requires the use of a **low-power tractor**.

Work **speed** can vary **from 3 to 4 km/h**.
